

HY-SI[®]

Helping You Succeed In Hay and Silage

Gandy

FEED INGREDIENT APPLICATORS

For Silage inoculants
Forage preservatives
Feed additives

12V electric motor,
110V motor optional

Capacities from 45 to
90 lbs. with extension

Precision cam gauge metering

Two spout bottoms

Chain guard a standard
safety item

**Accurate metering
of feed ingredients**

Precise low volume distribution of ingredients is important to preserve or fortify feedstuffs properly. And metering the correct amount is important for economy. Gandy feed ingredient applicators deliver the essential accuracy you need through a precision metering system. The precision cam gauge mounted on the stainless steel slide regulates the openings in the bottom to apply the rate recommended for your individual operation. With cam set to the desired position, shutter slide is opened so cam rests against stop. The material then flows through these precisely regulated openings at a constant rate. Material is continually supplied to the openings by an internal rotor powered by electric motor drive.

**Adaptable to
field operations,
yard locations**

Mounting brackets included are a 'U' frame for attaching to vertical surfaces and an angle bracket for attaching to horizontal surfaces of feed handling equipment. These brackets can also be adapted to suit your own specialized mounting requirements. Use in conjunction with feeding systems, silage blowers, choppers, balers, or wherever recommended by manufacturers of the products being applied. Mount the electrical switch where convenient for immediate shutoff of the unit. Each applicator has 25 feet of electrical wiring supplied as standard equipment.

**An easy-to-use
profit booster**

Preservatives, inoculants or minerals to boost nutritional value of feedstuffs can be easily added during normal handling operations. Mounted so the feedstuff passes under its spouts, the Gandy applicator assures ingredients are distributed evenly. The electrical switch controls start-stop to coincide with feed handling so operation takes no longer, yet added ingredients increase feed value for higher profits. Gandy applicators are easy to maintain. Bottom and slide are stainless steel and snap off for quick and thorough cleaning. Just snap back onto hopper body and unit is ready for next use. Wick-lubricated rotor bearings require only a few drops of oil periodically.
